CS graduate from SMU (AI & Business Analytics) with hands-on experience shipping Android features at TikTok and building backend systems at Thales. Proven track record delivering production-grade software across mobile, microservices, and cloud infrastructure.

EXPERIENCE

TikTok

Singapore

Android Software Developer Intern

Jun 2025 - Dec 2025

- Ideated, designed, and delivered a new Android feature in Kotlin that drove a 20% increase in overall product revenue, owning the full development lifecycle from design through production.
- Led the refactor and migration of a key business feature into a standalone module, enhancing scalability and simplifying future development.
- Built a robust event-tracking system using Android instrumentation to enable accurate real-time match analytics, supporting data-driven product decisions.
- Identified and resolved high-impact defects across the Android codebase, improving platform stability and user experience at scale.
- Solely owned and shipped a major product feature independently, a scope typically requiring a 2–3 person team, under tight staffing constraints with minimal supervision and no handoffs.

Skills: Java/Kotlin, Animations, Git, Event Tracking, System Architecture and Design, Documentation

Thales Group (DIS)

Singapore

Software Developer Intern

Jan 2025 - May 2025

- Led the upgrade and migration of the user tracking database, leveraging Docker for containerization and JDBC for seamless integration.
- Proposed enhancements to data collection strategies and optimized data utilization to improve test case coverage, enabling developers to proactively identify and resolve potential issues before they reach end users.
- Engineered automated behaviour driven development (BDD) tests with Java, Cucumber, and Gherkin that cut testing time from hours to minutes, directly improving release cadence and reducing manual QA dependency.

Skills: Java, Cucumber, Gherkin, Database migration, Unit/Integration testing, Docker, CI/CD, Git.

Mirae Distributions (DNDTS)

Singapore

Assistant Software Developer

May 2024 - July 2024

- Automated repetitive HR workflows using Python, saving an hour of manual work daily and freeing the HR team for higher-value tasks.
- Developed a real-time power outage alert system in Python and PowerShell that notified senior management instantly, successfully catching 1 critical outage before it escalated.
- Designed and deployed HR dashboards in collaboration with the HR team, enabling rapid self-serve access to employee data and reducing ad-hoc report requests.
- Validated and cleansed user input data to maintain data integrity across HR systems, reducing downstream errors in reporting.

Skills: Python, Selenium, Powershell, Workflow automation, Dashboarding, Data Validation/Cleaning, System Alarms

PROJECTS

Speed Card Game

Jan 2026 - May 2026

- Architected and shipped a fully online 1v1 real-time card game with sub-second response times, delivering a competitive player experience centered around speed of play.
- Built scalable backend microservices in Go for core platform concerns, including card management and authentication, leveraging Go's concurrency model to serve multiple sessions simultaneously with minimal overhead.
- Developed the authoritative game server in C++, handling real-time game state, move validation, and synchronisation between players with deterministic, low-latency logic critical for a speed-based game.
- Provisioned and managed cloud infrastructure using Terraform (Infrastructure as Code), achieving high service availability and enabling repeatable, version-controlled deployments across all services.
- Designed and implemented a CI/CD testing pipeline using GitHub Actions, automating build verification and test execution on every push, reducing integration bugs and ensuring consistent code quality across the Go and C++ codebases.

Technologies: Golang, C++, Terraform, GitHub Actions (CI/CD), Cloud Infrastructure, Real-Time Systems

Telemetry (UBS)

Jan 2025 - May 2025

- Designed and implemented a fire-and-forget notification system using RabbitMQ, enabling low-latency delivery of alerts via email and Telegram.
- Built a responsive React frontend with an interactive world map and integrated Grafana dashboards to visualize real-time telemetry data, enabling users to monitor system health across regions through an intuitive and dynamic UI.
- Integrated telemetry data from multiple businesses into a centralized dashboard, improving visibility and accelerating operational decision-making.
- Deployed on AWS to ensure fault-tolerant, cost-efficient infrastructure with automated scaling.
- Developed an LSTM-based anomaly detection model to proactively alert developers to critical system behavior, enabling faster incident response.

Technologies: RabbitMQ, Grafana, AWS (EC2/S3/RDS), Python, LSTM, Machine Learning

Cheaty Fetch

Jan 2025 - May 2025

- Engineered a Python/Selenium web scraper to aggregate real-time trading card prices across multiple Singapore retailers, delivering accurate and current product listings at scale.
- Architected a caching layer to optimise price lookup latency while maintaining data freshness, balancing performance with accuracy for end users.
- Built a responsive React frontend with intuitive search and filtering, enabling seamless cross-retailer price comparison in a single interface.
- Containerised the full-stack application using Docker, streamlining local development, environment consistency, and deployment across services.

Technologies: Python, Selenium, Web Scraping, Caching, React, Docker, Full-Stack Development, REST APIs

Urban Farm

Jan 2024 - May 2024

- Developed a fully functional Android game with independent, concurrent game systems, implementing a custom multithreaded architecture to manage game loops, UI updates, and background logic simultaneously without blocking the main thread.
- Applied multithreading best practices to isolate game subsystems (e.g. event handling, animations), preventing race conditions and ensuring a smooth, responsive player experience.
- Engineered a robust local storage system to persist user game state (inventory, progress, attributes) across sessions, delivering a seamless continuity of experience without requiring a backend server.
- Designed the data persistence layer to handle serialisation and deserialisation of complex game objects efficiently, minimising load times and reducing the risk of data corruption on app restart.

Technologies: Java/Kotlin, Android SDK, Multithreading, Local Storage, SQLite

EDUCATION

Singapore Management University

Singapore

BSc Computer Science

Aug 2022 - May 2026 (Expected)

- Major: Artificial Intelligence · Second Major: Business Analytics
- GPA: 3.23/4.00 (High Merit)

CERTIFICATIONS

- Cybersecurity Hacking Fundamentals by SMU WhiteHats.
- Digital Analytics and Optimization (IBF) by Laures Academy.
- Google Data Analytics by Google. Certificate earned at August 31, 2024

SKILLS

Technical Skills & Tools

- **Programming Languages:** Python, Java, Kotlin, C++, Go, JavaScript, SQL, Google Apps Script, VBA
- **Frameworks & Libraries:** Spring Boot, React, Svelte, JDBC, JPA, Cucumber/Gherkin
- **Tools & Platforms:** Git, Docker, Kubernetes, AWS (EC2/S3/RDS), RabbitMQ, Grafana, Terraform, GitHub Actions, Selenium, Jira
- **Concepts:** Multithreading, CI/CD, BDD Testing, REST APIs, Microservices, Cloud Infrastructure, Machine Learning (Computer Vision, LSTM)

Personal Attributes

- Ambitious, resilient, meticulous, open-minded, and creative.

INTERESTS & HOBBIES

- Bowling: participated in 'B' and 'A' Divisions
- Collectable Card Games (MTG)
